Maintaining the Pulse in Agricultural Resilience

- Sydney Institute of Agriculture

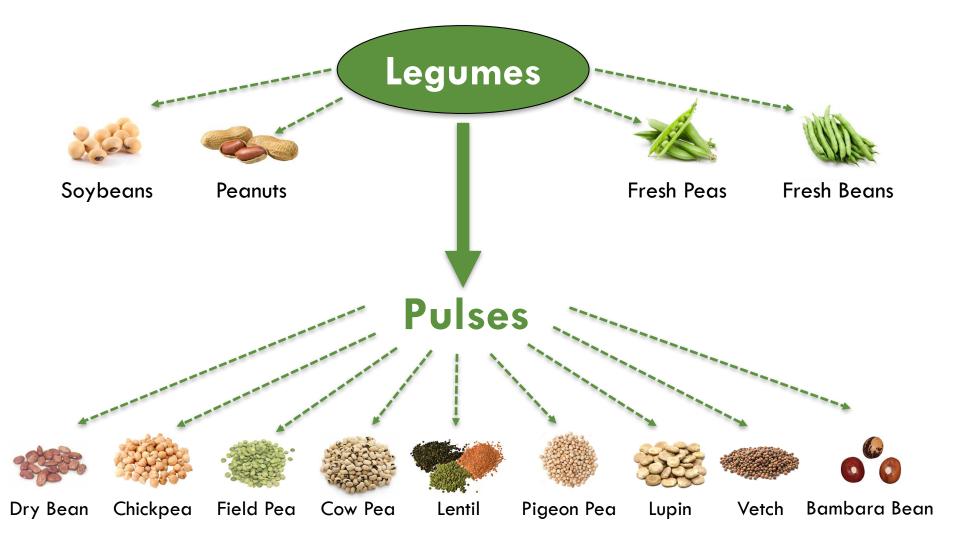

Presented by Associate Professor Brent N. Kaiser Director - Legumes for Sustainable Agriculture

Faculty of Science School or Life and Environmental Science

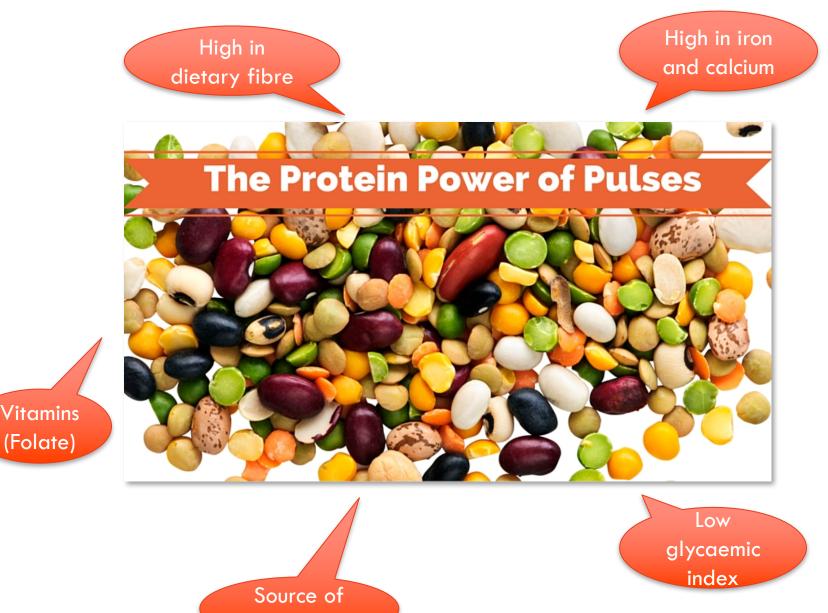

What is a Pulse?

Pulses are good for you!

anitoxidants

Pulses are good for Agriculture

- Rotational crops
 - Break disease cycles
 - Disrupt weed populations
 - Provide soil nutrition

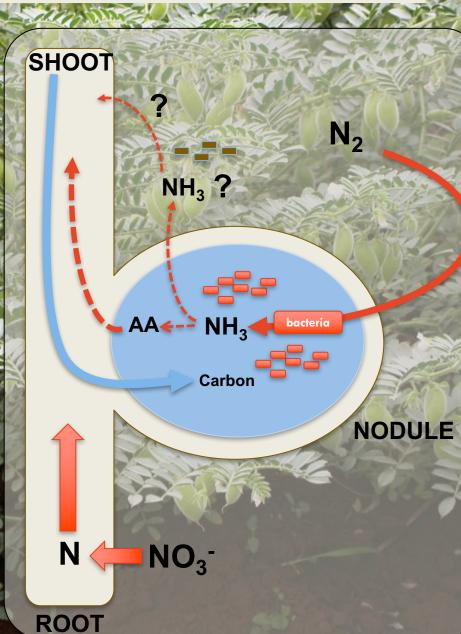

Pulses Fix Nitrogen (N₂) – Nitrogen self-sufficiency

N to grow and set seed

- Soil N for other crops
 - Wheat, Canola, Maize

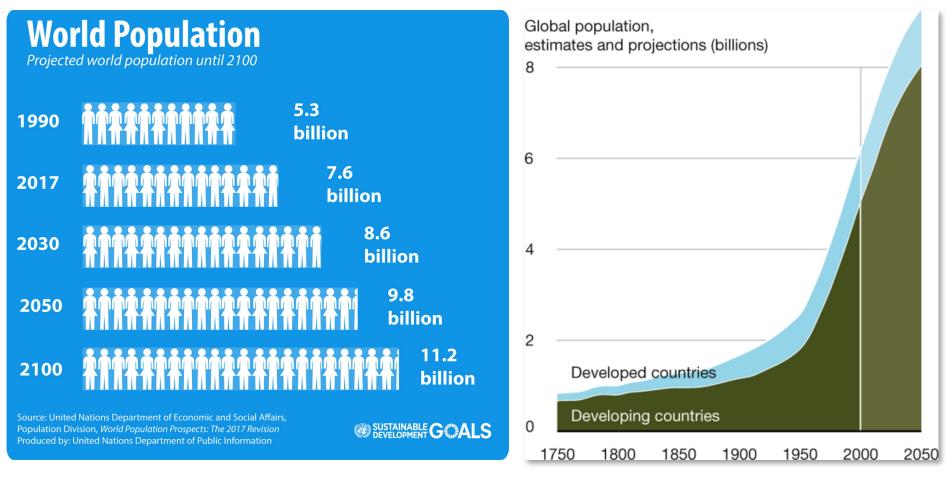

Nodules

- Soil microbes

Population Growth – Ensuring Food Security

- World population is increasing
- How to feed \sim 9 billion people by 2030?

Australian Pulses are in Demand!

VOLATILITY IN PRODUCTION

 Production (In million tonnes)

India: Pulse Demand - 2030

- Will require ~40 million tonnes (MT)
 - 2015 Indian production ~ 15 MT
- India will require ~1.5 MT of extra pulses per annum!

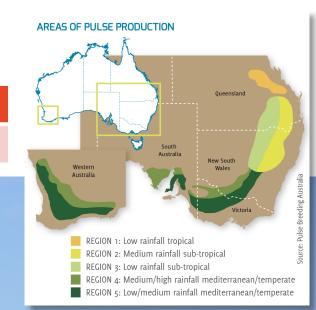

Australian Pulse Production

2017 Forecast: ~ 3 Million MT combined harvest

Chickpea	Lentil	Faba bean	Field Pea	Lupin
1.5 MT	370 KT	300 KT	280 KT	500 KT

A DESCRIPTION OF THE OWNER OF THE

Chickpea Harvest

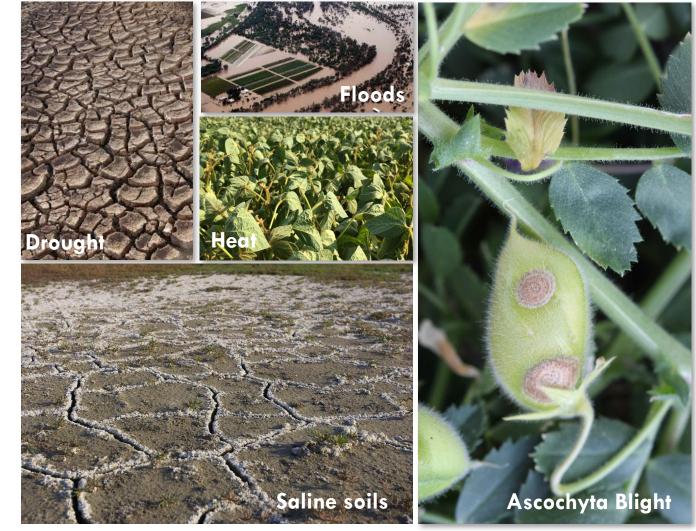

Australian pulse production is not secure

- Pulse production (yield and quality) subject to unpredictable and challenging environments
 - Drought, heat, flood, frost, degraded soils

Challenges facing Australian pulse production

- Climate variability
 - Drought
 - Heat
 - Flooding
 - Salinity
- Disease
- Reliability
 - Profitability

Genetic resilience – key to sustainability

- Genetic improvement will mitigate the impact of climate change and disease – pathway to enhanced quality and yield
- 1) Basic Research to identify resilient traits (genes and proteins)
- 2) Translatable Research to introduce traits
- 3) Plant Breeding to deliver the physical outcomes to growers
- 4) Societal support that enables genetic improvement
 - Valuing agriculture and its role to meet global food demands
 - Prioritization of research funding to ensure long-term outcomes occur

ARC Industrial Transformation Research Hub

Basic and Transformational Research for _ Legume Resilience

Australian Government

Australian Research Council

THE AUSTRALIAN NATIONAL UNIVERSITY

SARDI

SOUTH AUSTRALIAN **RESEARCH AND**

DEVELOPMENT

A TROBE UNIVERSITY

LSA Research Aims

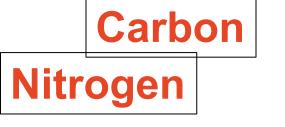

Develop pulses for increased **resilience** to abiotic stress

Optimise plant resource partitioning to enhance yield under stress.

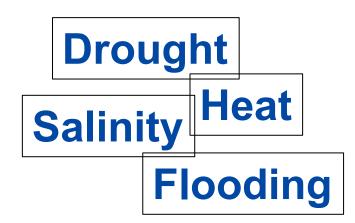

The University of Sydney

—

Nodules Enhance N₂-fixation of pulses for annual and rotational crop production

Page 13

Summary

- Pulses are important to Australia's agricultural sector and its long-term sustainability
- Legumes for Sustainable Agriculture has been developed to deliver pulse research and development to Australia
- Legumes for Sustainable Agriculture and the Sydney Institute of Agriculture will spearhead new investment and research activity focused on pulse improvement and their role in meeting global food challenges

Thankyou
